

R66T™ Wi-Fi apps

Engaging Apps for Wi-Fi Environments

Powered by our proprietary UX1 hardware and compression software, our Wi-Fi environments allow for the introduction of apps designed specifically to run on 802.11 networks. These apps leverage our proprietary search engine, our aggregated local data and our customer and businesses user base.

Wi-Fi apps are designed to run on hotspots from any connected device (pads, mobile phones and laptops). Look for our current app line up from the R66T Wi-Fi Dashboard

All Clear™

The R66T All Clear™ Alert system takes advantage of the largest private network in the country in order to offer cities and governments a vital communication tool that can reach both businesses and citizens in real time.

- We take advantage of our proprietary system that connects businesses to the traveling population via our ad management tools, private Wi-Fi networks, and mobile phone applications
- Our system caters to travelers who are most in need of situational awareness while away from home
- We've developed custom tools that allow city and government administrators to both push information to businesses and citizens, and also pull information via crowd sourcing
